

OpenAI · Strategic BDR, APAC

Seth Lim

Sales Development Interview

DoorDash account thesis · July 2026

Why me

What makes me a strong fit?

Enterprise selling across APAC, plus enough technical depth to make AI opportunities concrete.

01

Sales experience in APAC

- 200%** of quota at Airwallex, focused on outbound in Singapore
- 3 markets** as Boxo’s founding enterprise sales lead across the Philippines, Vietnam and Malaysia

02

Technical depth in AI

- End to end** enterprise healthcare workflows deployed with a YC startup in San Francisco
- Hands-on builder** agentic systems for startups, from research and enrichment to workflow execution

Sales judgment × technical fluency → customer confidence

Part 2 · Advise DoorDash

DoorDash Case Study

From global operating leverage to one measurable AI wedge.

DOORDASH

Local commerce at global
scale

Three-year AI point of view

DoorDash Global Coverage

Global reach makes local operating complexity compound.

40

countries across
DoorDash, Wolt and
Deliveroo

Different languages.
Different policies.
Different exceptions.

DoorDash Profitability Challenges

For every **\$100** customers spend through DoorDash

\$12.80 recorded as revenue

\$0.60 ends as net income

At these margins, every cent saved on operations is significant.

One system must support all three sides

Consumers

Merchants

Dashers

Consolidated into a shared AI operating stack

Problem Statement

Consumers • Merchants • Dashers

01

What is happening now

DoorDash must support three audiences across **different languages, country-specific policies and local exceptions.**

02

What negative consequences it creates

At scale, that complexity compounds through **more local training, more manual support calls and less consistent resolution.**

03

Why it matters strategically

As the network grows, cost-to-serve and operating complexity rise with it - putting pressure on **supply reliability and market economics.**

One high-impact use case

Multilingual Voice Agent for Dasher Reactivation

North-star ROI question Value created by reactivated Dashers – cost to bring them back Does voice improve the economics of reactivation?	
01 • Outcome Reactivation rate Inactive Dashers who return to an active delivery.	02 • Unit economics Cost per reactivated Dasher Total pilot and operating cost per successful reactivation.
03 • Speed Time to return Median time from first contact to the next completed delivery.	04 • Quality Follow-up support rate Share of cases requiring another support contact after the voice interaction.

Baseline → pilot cohort → measured delta

Customer-validated. No invented ROI.

Earning credibility with technical assessment and demo

Voice Agent Contact Center Workflow

Bounded automation: approved knowledge and tools, with explicit human handoff.

Potential Champions

Public-role hypotheses - ownership must be verified through discovery.

OpenAI · APAC GTM

9:42 AM

Hi {{Name}}, I'm Seth from OpenAI's GTM team.

{{Relevant personalisation. Default to common alumni or warm intro from network}}

We recently released GPT-Realtime-2.1, a voice model built for natural two-way live conversations. Enterprises like {{most adjacent case studies identified from CRM}} who use this for support use cases have seen {{case study metric}}.

We have a demo tailored to DoorDash for rider reactivation that we can show over a call.

If we could help DoorDash improve {{hair-on-fire metric}}, would that be a priority this quarter?

- 01

Personalisation

A specific signal, relevant news or warm introduction - never generic praise.
- 02

Adjacent proof

The closest credible support or voice case study, with a real metric from the CRM.
- 03

Business metric

A priority measure tailored to the stakeholder's role, mandate and decision criteria.

Same use case → metric tailored to each stakeholder's role.

30-Day Path to a Sponsor-Backed PoC

Move from an external hypothesis to a customer-owned, technically credible opportunity.

Days 1-5 Map the account	Days 6-10 Validate the problem	Days 11-20 Prove the use case	Days 21-30 Mobilize the PoC
Key actions - Rank DoorDash business priorities - Map exact titles and warm paths Evidence created Account thesis + stakeholder map	Key actions - Run operator discovery - Test and develop the champion Evidence created Customer-owned problem statement	Key actions - Present the tailored demo - Assess feasibility, guardrails and ROI metrics Evidence created Technical path + draft business case	Key actions - Align sponsor and technical owner - Confirm scope, approval path and next step Evidence created Sponsor-backed PoC plan
Hypothesis	→ Customer evidence	→ Technical confidence	→ Sponsor commitment

What We Need From the Champion

Together, we align the people, evidence and decisions needed to move the PoC forward internally.

01 People • Champion • Operator subject-matter expert • Technical owner • Economic sponsor	02 Knowledge & access • Approved SOPs and FAQs • Anonymised sample data • Workflow and API constraints • Current support baseline	03 Decisions • Success metrics • Human handoff boundaries • PoC scope • Approval and buying path
---	--	---

Outcome

A scoped opportunity DoorDash can sponsor, test and expand.

Standout approach

I would make the opportunity tangible before asking DoorDash to commit to it.

Enterprise sales judgment ✖ hands-on technical fluency

Start Undefined business problem What is actually happening in the customer's operation?	Frame Workflow hypothesis Map the logic, assumptions and handoff points.	Prove Tailored demo Give operators something concrete to test, challenge and improve.	Progress Customer-validated opportunity Refine the scope, proof criteria and next step with customer feedback.
---	---	--	---

The result

A vague AI idea becomes a scoped opportunity the customer can evaluate and progress internally.
